TOO MANY TABS, TOO LITTLE CLARITY

Solana ETF Intelligence

US Solana ETF flows, price and on-chain data on one screen

Crypto investors check ETF flows, SOL price and on-chain data in different places. It is slow and easy to misread.

- ETF flows, price and on-chain data live on separate sites

02

How it works

Pick a period, and the whole screen updates. ETF flows lead the page, with price, on-chain data and AI Insight beside them.

- Switch between 7D, 30D and 90D with one tap
- Big net inflow number and a daily bar chart for ETF flows
- SOL price chart and on-chain cards: addresses, transactions, DEX volume
- AI Insight card: three short lines for each period

03

Why it matters and what's next

One clear screen helps investors read the market faster. Today the app runs on demo data, and every number says so.

- Faster reading of ETF flows, price and usage together
- Dark terminal style with monospace numbers and thin lines
- Every number is marked DEMO DATA, so nothing is misleading
- Next step: connect real data sources
